- SuperKEKB is an asymmetric  $e^+e^-$  - collider located in Tsukuba, Japan
- CM energy: 10.58 GeV ( $\Upsilon(4S)$  resonance)  
Tuneable between  $\Upsilon(2S)$  and  $\Upsilon(6S)$  resonance as well

**Target peak luminosity :  $6 \times 10^{35} \text{cm}^{-2}\text{s}^{-1}$**   
**Achieved (May 2021) :  $2.8 \times 10^{34} \text{cm}^{-2}\text{s}^{-1}$**

- Pilot run in 2018:  $500 pb^{-1}$  recorded
- Integrated luminosity (May 2021) :  $> 150 fb^{-1}$

**Objective:  $50 ab^{-1}$  by 2030**

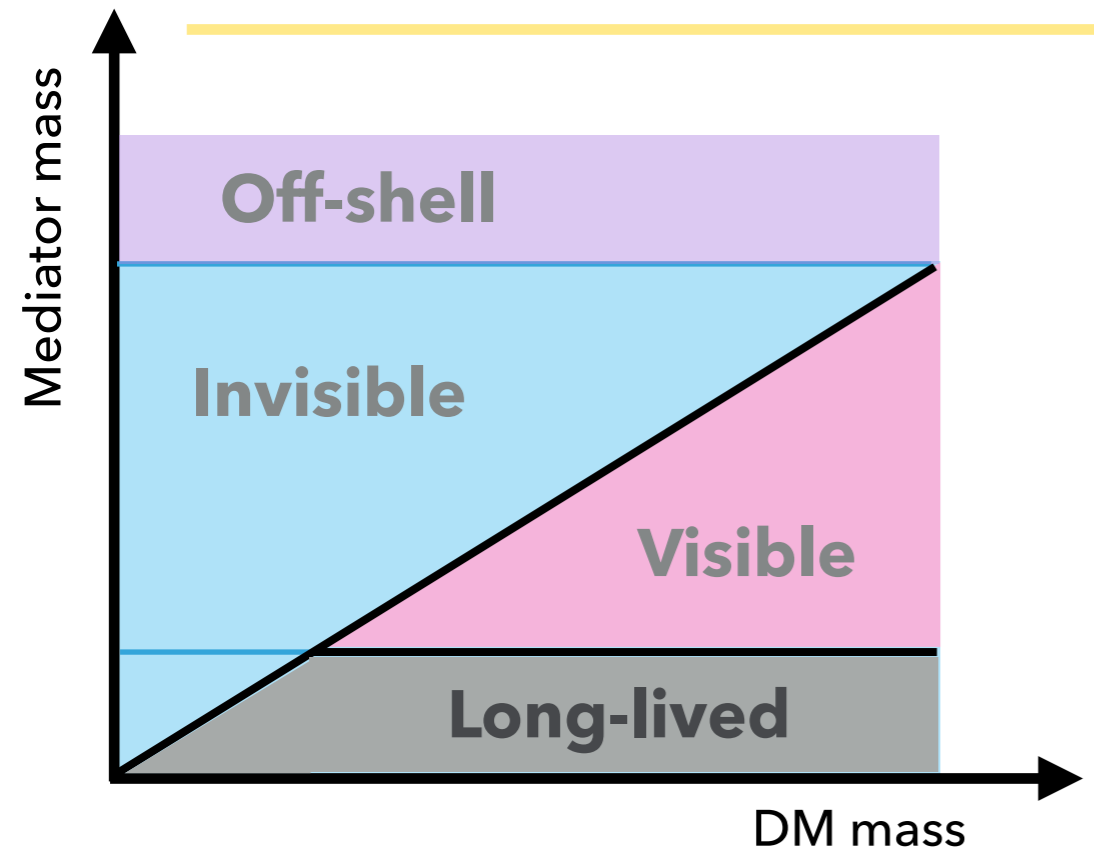

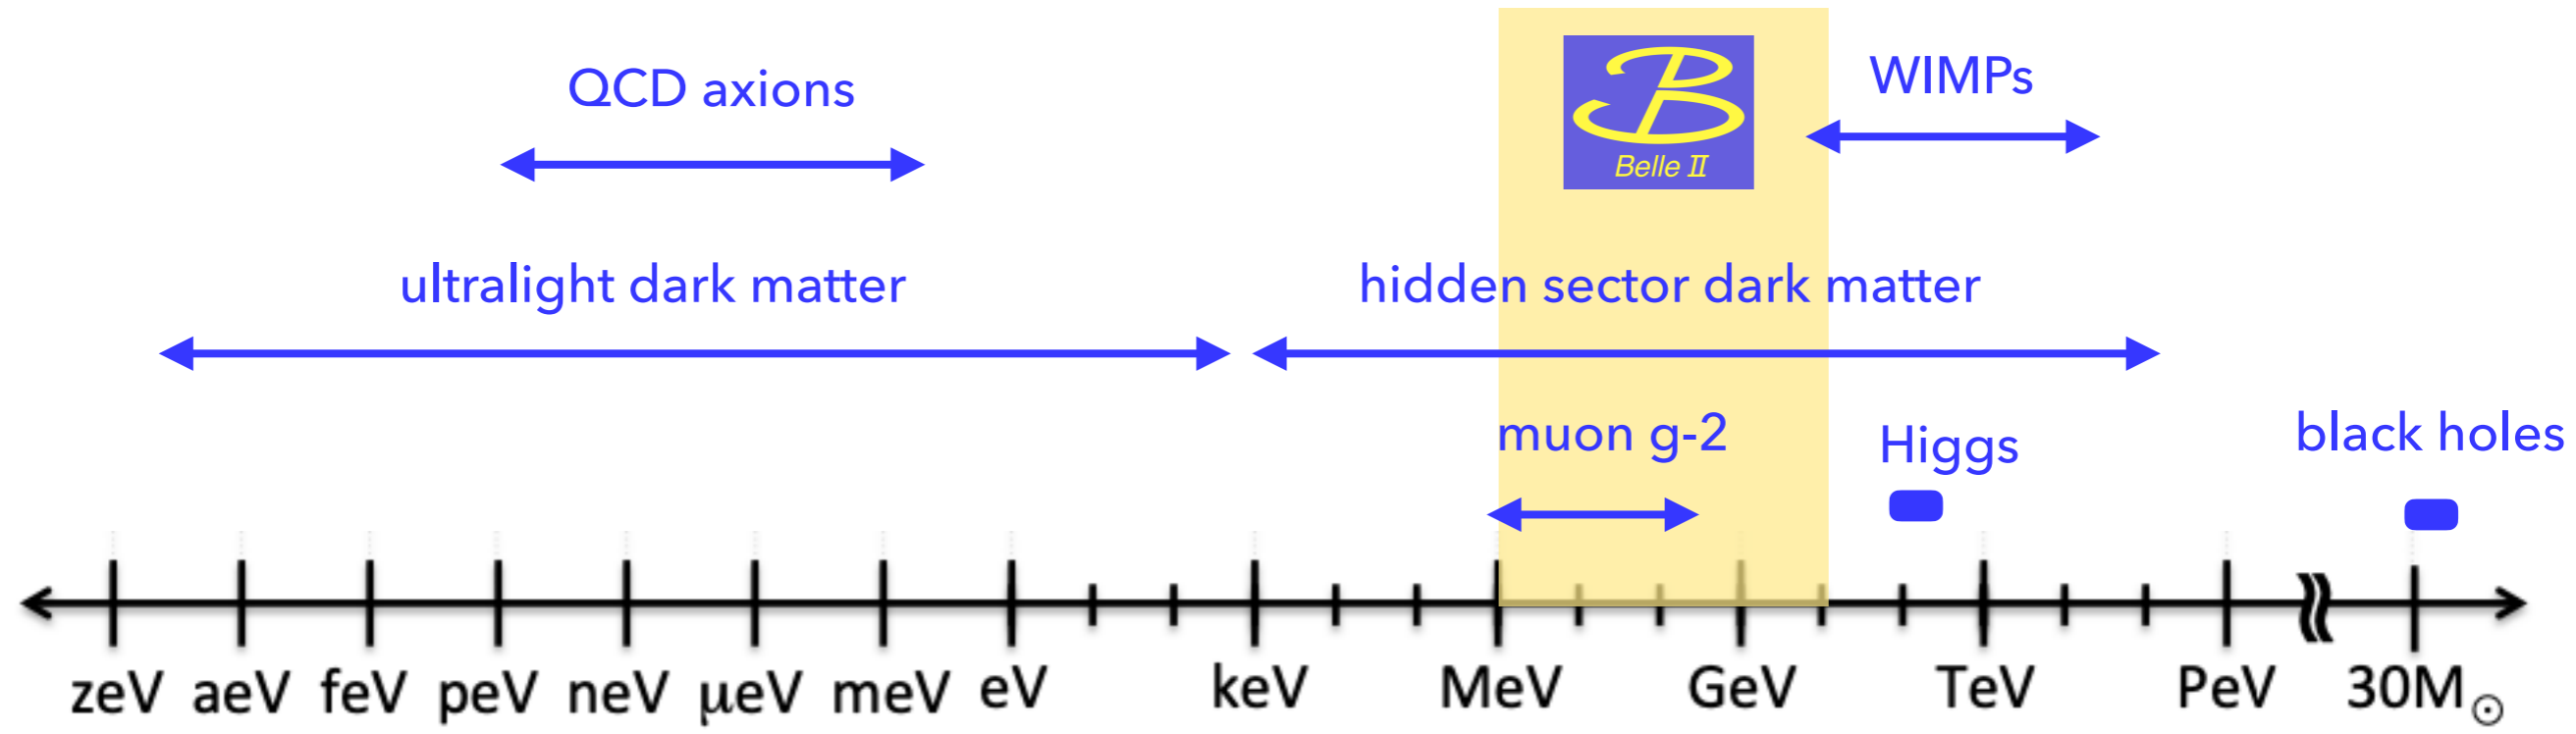

Models for low-mass (sub-)GeV DM with light dark mediator between Standard Model (SM) and DM

## Possible portals between DM and SM

- Vector portal (dark photon  $A'$ , dark  $Z'$ )
- Pseudo-scalar portal (axion-like particle)
- Scalar portal (dark scalars)
- Neutrino portal (sterile neutrino)

- Dark matter searches at Belle II profit from:**
- Well-defined initial conditions
  - Hermetic detector
  - Clean collision environment
  - Excellent PID
  - Dedicated low-multiplicity triggers

arXiv:1707.04591

Shuve et al. (2014) Phys. Rev. D 89, 113004

Altmannshofer et al. (2016) JHEP 1612 106

- $L_\mu - L_\tau$  model: new **light gauge boson  $Z'$**  arises that only couples to 2nd and 3rd lepton family

- Model might explain:

- Dark matter puzzle
- $(g - 2)_\mu$  anomaly
- $B \rightarrow K^{(*)} \mu\mu$ ,  $R_{K^{(*)}}$  anomalies

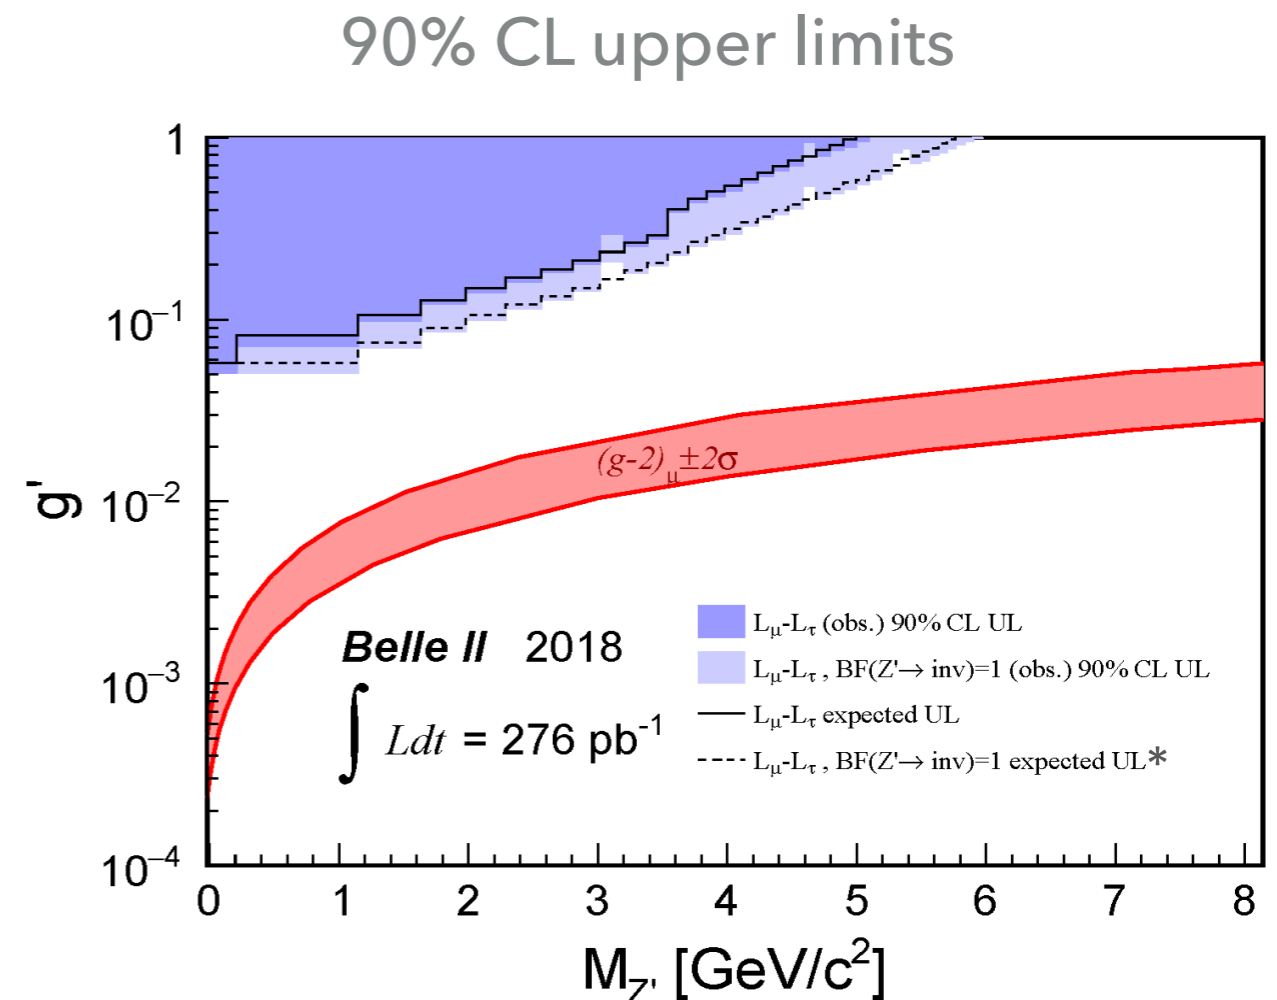

$$e^+e^- \rightarrow \mu^+\mu^-Z'$$

$$Z' \rightarrow \text{invisible}$$

- Experimental search for  **$Z'$  decaying invisibly**
  - Searching for peak in the recoil system against  $\mu\mu$

- Search performed with only  $276 \text{ pb}^{-1}$  that was taken during the 2018 pilot run of Belle II
- **Improvements** :
  - New triggers
  - PID system
  - Analysis techniques based on machine learning

First Belle II physics paper:  
PRL 124, 141801 (2020)

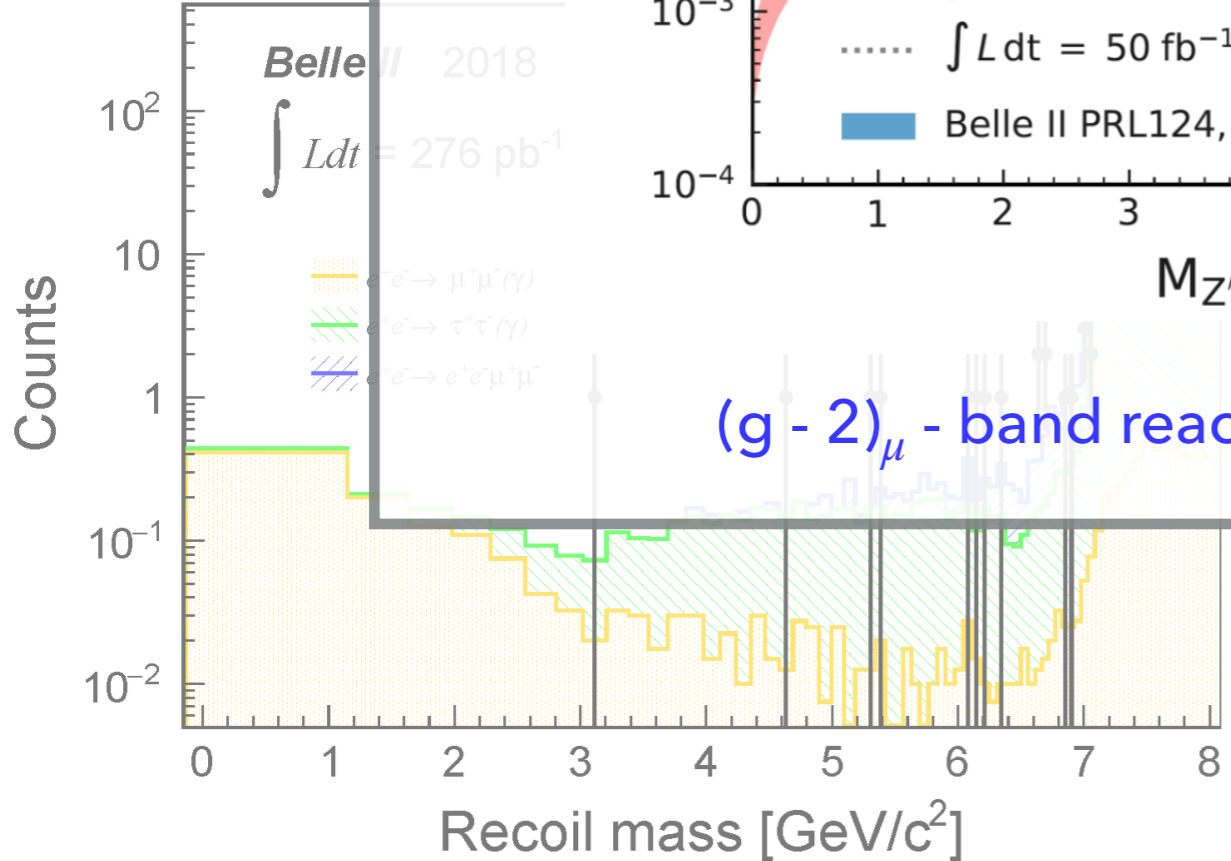

# Invisibly decaying Z' boson

- Search performed with only  $276 \text{ pb}^{-1}$  that was taken during the 2018 pilot run of Belle II preliminary (conservative) systematics

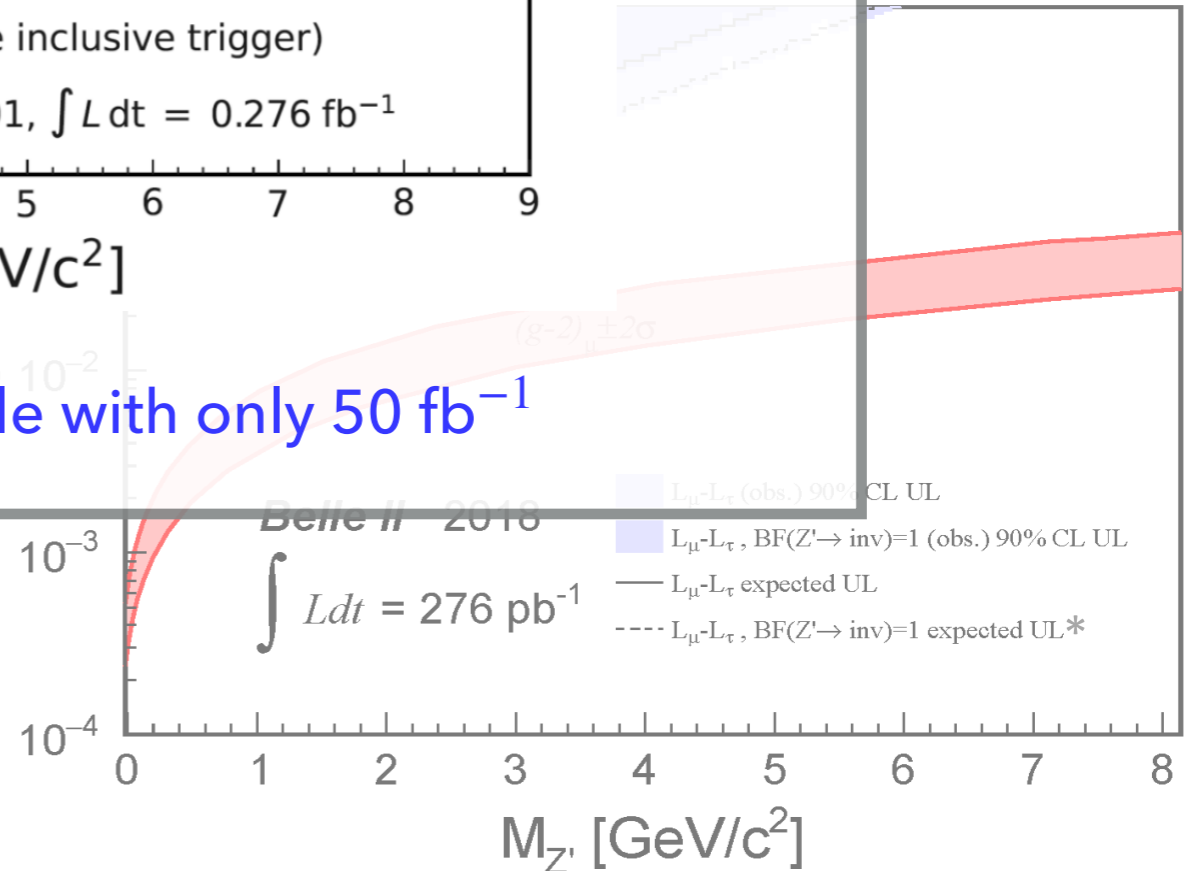

• Improvement

- New trigger
- PID system
- Analysis on machine

II physics paper:  
41801 (2020)

$(g-2)_\mu$  - band reachable with only  $50 \text{ fb}^{-1}$

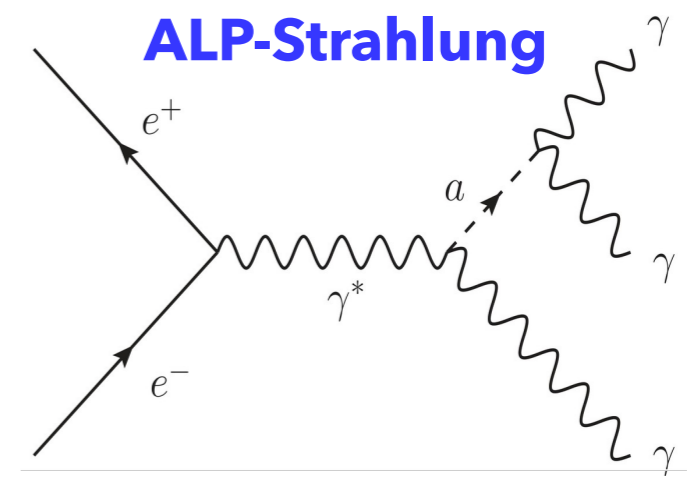

- Axion Like Particles (ALPs) are pseudo-scalars coupling to bosons which appear in several BSM models

- Analysis performed with  $445 \text{ pb}^{-1}$  recorded during 2018 pilot run

- Search for peak in :

Belle II focusing on ALPs coupling to photons

Diphoton invariant mass (low  $m_a$ )

Recoil invariant mass (high ALP mass  $m_a$ )

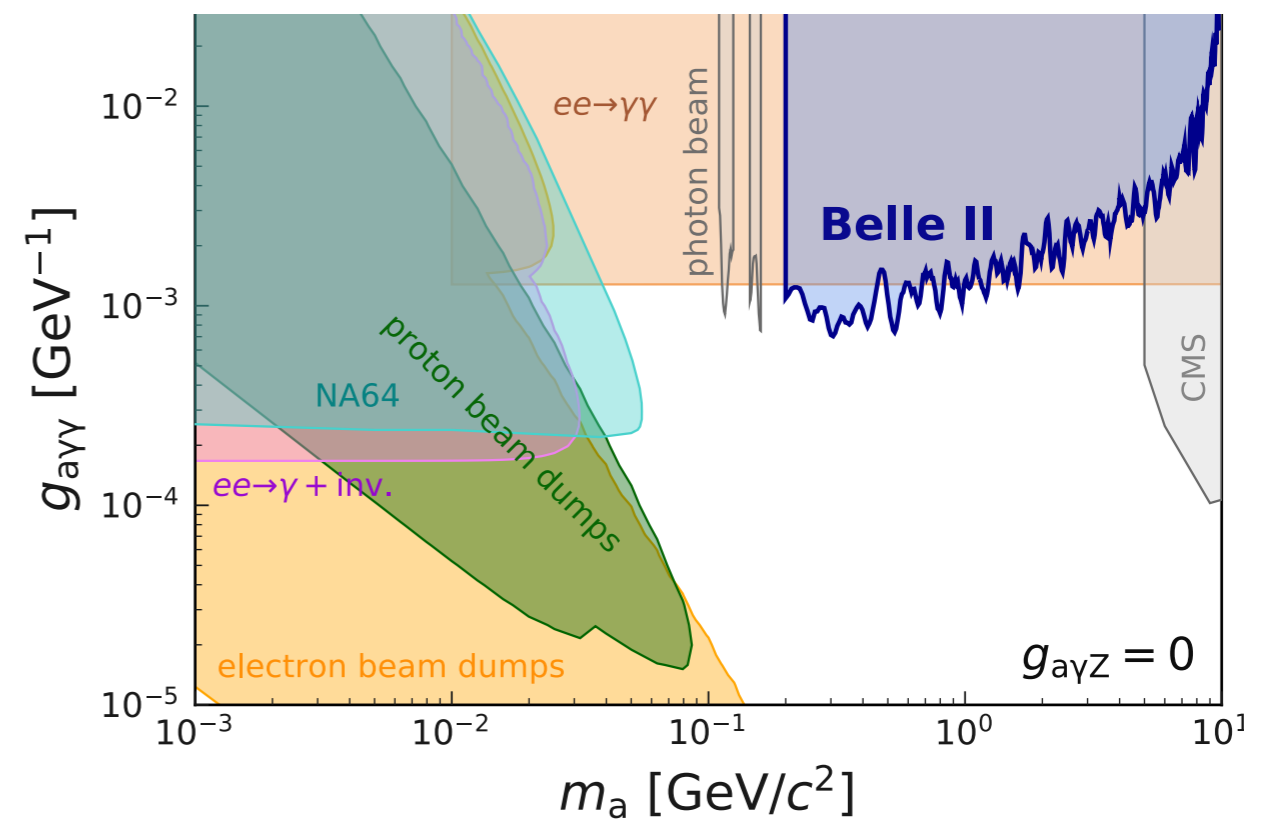

- Mass range between 0.2 to 9.7 GeV/c<sup>2</sup> studied
- No excess was found
- Upper limits on cross section translated to coupling constant

Belle II physics paper:  
PRL 125, 161806 (2020)

$$\sigma_a = \frac{g_{a\gamma\gamma}^2 \alpha_{\text{QED}}}{24} \left(1 - \frac{m_a^2}{s}\right)^3$$

90% CL upper limits on the cross section

- **Dark photon  $A'$**  : new massive gauge boson coupling to SM photon by kinetic mixing with mixing strength  $\epsilon$

- Invisible decay:  $e^+e^- \rightarrow \gamma_{ISR}A' \rightarrow \gamma_{ISR}\chi\bar{\chi}$

- Search for **single photon in the detector**

- Requires single photon trigger and **precise knowledge of detector acceptance** to reject background

- Background sources:

- $e^+e^- \rightarrow e^+e^-\gamma(\gamma)$
- $e^+e^- \rightarrow \gamma\gamma(\gamma)$
- Cosmics

- Belle II has an extensive program of dark sector searches
- First results published:
  - $Z'$  to invisible [PRL 124, 141801 \(2020\)](#)
  - Search for ALPs [PRL 125, 161806 \(2020\)](#)
- Many more results expected in the near future

## Other ongoing studies:

- Dark Higgs-Strahlung
- Dark Scalar
- Other  $Z'$  decays
- Inelastic dark matter
- And many more

- More details :

The Belle II Physics Book, December 2019, [arXiv:1808.10567](#)

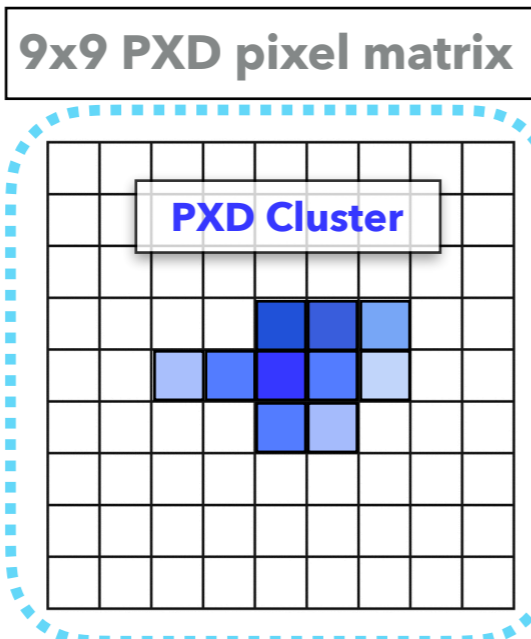

# BACK-UP

## Search for rare events (anomalies) in background

### Pixel Detector (PXD)

- Classifier tags anomalous data (high classifier loss) that is worth undergoing a detailed study
- Model independent search
  - ➔ No models for background and new physics scenario

- Classifier is trained on background only (either simulated or data) and later presented to a dataset that potentially contains signal

*Example: Simulation of magnetic monopoles (MM)*
