

# Time-dependent CP violation in B<sup>0</sup> decays

S. Bahinipati Indian Institute of Technology Bhubaneswar

16th International Conference on Heavy Quarks and Leptons (HQL2023) TIFR [November 28 - December 2, 2023]

### **Talk Outline**

- Introduction
- Time-dependent CP violation
- Detectors: Belle II, LHCb
- Recent results from Belle II

 $\begin{array}{l} B^0 \rightarrow \eta' \ K_s \\ B^0 \rightarrow K_s \ K_s \ K_s \\ B^0 \rightarrow \Phi \ K_s \\ B^0 \rightarrow K_s \ \pi^0 \\ B^0 \rightarrow K_s \ \pi^0 \gamma \\ B^0 \rightarrow J/\psi \ K_s \end{array}$ 

• Recent results from LHCb

 $B^{0} \rightarrow J/\psi K_{s}$   $B_{s} \rightarrow J/\psi \Phi$   $B_{s} \rightarrow \Phi \Phi$ [Bhagyashree's talk]

• Summary and Outlook

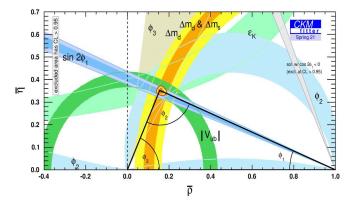

### Introduction

- CP violation in Standard Model (SM) is manifested due to a complex phase in the CKM matrix.
- Unitarity of the CKM matrix leads to triangles in the complex ( $\rho$ ,  $\eta$ ) plane.
- Unitarity Triangles are closed in the SM. Any deviation would be a hint for New Physics.
- Precise measurements by Belle, Belle II, LHCb and others lead to improved precision in the measurement of the angles.

(HFLAV 2021)

 $\beta = \phi_1 = (22.2 \pm 0.7)^\circ$ 

$$\Phi_1 = \arg\left(-\frac{V_{cd}V_{cb}^*}{V_{td}V_{tb}^*}\right) \cong \arg(V_{td})$$

### **Time-dependent CP violation**

CP violation in interference of decays with/without mixing (meson oscillation):

$$\Gamma(P^0(\rightsquigarrow\bar{P}^0)\to f)(t)\neq \Gamma(\bar{P}^0(\rightsquigarrow\bar{P}^0)\to f)(t)$$

$$\begin{split} A_{CP}(t) &= \frac{\Gamma_{P^{0}(t) \to f} - \Gamma_{\bar{P}^{0}(t) \to f}}{\Gamma_{P^{0}(t) \to f} + \Gamma_{\bar{P}^{0}(t) \to f}} \\ &= \mathbf{S_{CP}} \operatorname{sin}(\bigtriangleup m_{d} t) - \mathbf{C_{CP}} \operatorname{cos}(\bigtriangleup m_{d} t) \end{split}$$

 $B^0$  f interference  $\bar{B}^0$ 

#### Time-dependent CPV

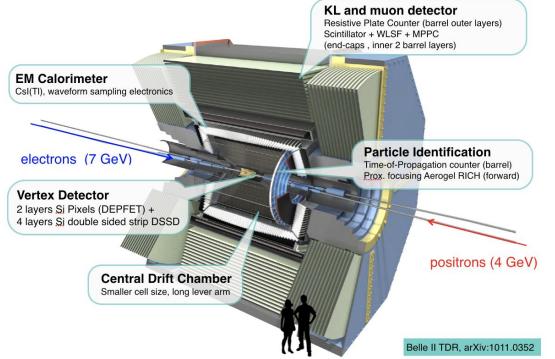

Mixing-induced CP Direct CP asymmetry

In Standard Model, C= 0, S =  $sin2\phi_1$ 

### **Belle and Belle II**

- Asymmetric e<sup>+</sup>-e<sup>-</sup> colliders- B factories, also charm and τ factories
- Belle Belle II: e<sup>+</sup> (3.5 GeV) e<sup>-</sup> (8 GeV) e<sup>+</sup> (4 GeV) e<sup>-</sup>(7 GeV)
- Improved vertex resolution allows lower boost
- 424 fb<sup>-1</sup> (362 fb<sup>-1</sup> at Y(4S)) collected at Belle II so far; Goal: 50 ab<sup>-1</sup>

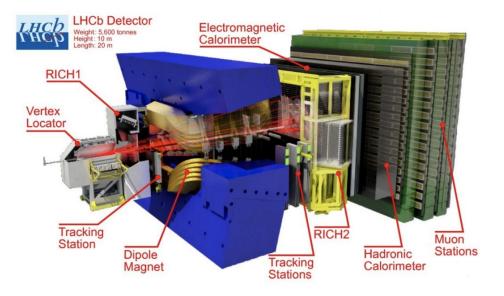

#### Luminosity Frontier experiment

### LHCb

#### **Energy Frontier experiment**

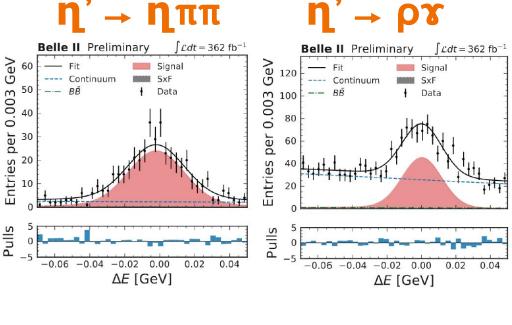

- Huge *b* cross-section
- Excellent vertex resolution and particle identification
- Events with high multiplicity, reconstruction of neutrals is challenging
- 9 fb<sup>-1</sup> accumulated during Run 1-2 (2010-2018)
- Run 3 started in 2022 with an upgraded LHCb detector, goal 50 fb<sup>-1</sup>

 $B^0 \rightarrow \eta' K_s$ 

- Random combination of tracks from qq leads to high background
- Event-shape MVA used to suppress this combinatorial background
- Signal yield = 829 +/- 15 events; Fit  $\Delta$ t to extract  $S_{CP}$ and  $C_{CP}$
- Background △t shape controlled from sideband

#### EPS-HEP 2023

 $\Delta E = E_B^* - E_{\rm beam}^*$ 

## $B^0 \rightarrow \mathbf{\eta}' K_s$

- S<sub>CP</sub> and C<sub>CP</sub> extracted from fit in signal region with background parameters fixed from first step
- Fit validated with  $B^{\pm} \rightarrow \eta' K^{\pm}$

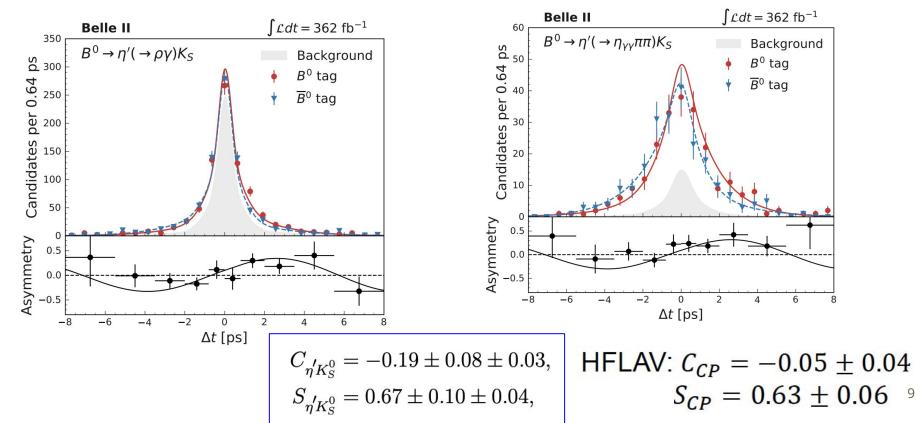

Signal yield	$C_{\eta' K^0_S}$	$S_{\eta'\!K^0_S}$
$358\pm20$	$-0.10\pm0.13$	$0.69\pm0.14$
$471\pm29$	$-0.24\pm0.10$	$0.65\pm0.13$
$55\pm8$	$0.11\pm0.32$	$0.25\pm0.50$
$829\pm35$	$-0.19\pm0.08$	$0.67\pm0.10$
	$     \begin{array}{r}       358 \pm 20 \\       471 \pm 29 \\       55 \pm 8     \end{array} $	$     \begin{array}{r} 358 \pm 20 & -0.10 \pm 0.13 \\             471 \pm 29 & -0.24 \pm 0.10         \end{array} $

Belle II

 $B^0 \rightarrow \eta' K_s$ 

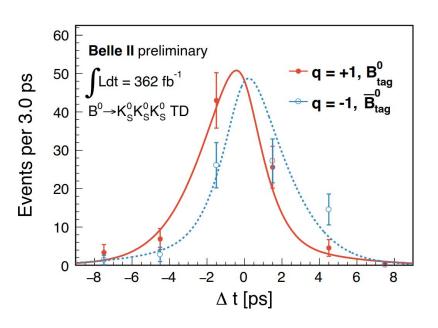

## $B^0 \rightarrow K_s K_s K_s$

- Major challenge: no prompt tracks→vertex reconstruction from Ks trajectories
- No contributions from opposite-CP backgrounds

$$C_{CP} = -0.07 \pm 0.20 \pm 0.05$$
  
$$S_{CP} = -1.37^{+0.35}_{-0.45} \pm 0.03$$

#### **MORIOND 2023**

HFLAV:  $C_{CP} = -0.15 \pm 0.12 S_{CP} = -0.83 \pm 0.17$ 

#### Phys. Rev. D 108, 072012 (2023)

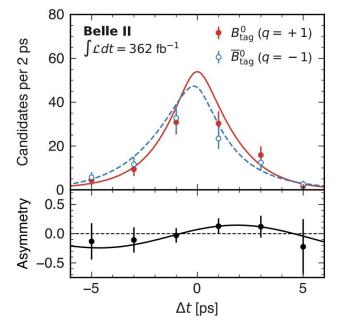

• Results competitive with best measurements

• Two prompt tracks from  $\Phi \rightarrow K^+K^-$ : Clean signature

 $B^0 \rightarrow \Phi K_c$ 

 Major challenge: non-resonant backgrounds with opposite-CP

 $C_{CP} = -0.31 \pm 0.20 \pm 0.05$  $S_{CP} = 0.54 \pm 0.26^{+0.06}_{-0.08}$ 

HFLAV:  $C_{CP} = 0.01 \pm 0.14 S_{CP} = 0.74^{+0.11}_{-0.13}$ 

 $B^0 \rightarrow K_s \pi^0$ 

- First Belle II measurement of CP asymmetries in the decay
- Results competitive with previous measurements
- Fitting to the proper decay-time distribution of a sample  $415^{+26}_{-25}$  signal events

$$C_{CP} = -0.04 \pm 0.15 \pm 0.05$$
  
$$S_{CP} = 0.75^{+0.20}_{-0.23} \pm 0.04$$

HFLAV:  $C_{CP} = 0.01 \pm 0.10 S_{CP} = 0.57 \pm 0.17$ 

## $B^0 \rightarrow K_s \pi^0 \gamma$

- Consider exclusive decay to  $K^{*0}(\rightarrow K_{s}\pi^{0})\gamma$  and inclusive decay to  $K_{s}\pi^{0}\gamma$  separately
- Polarization of photon strongly constrains flavor
- SM: *S*<sub>*CP*</sub> helicity suppressed NP processes could contribute to a significant mixing-induced CPV

HFLAV:

 $K^{*0}\gamma: \quad C_{CP} = -0.04 \pm 0.14 \ S_{CP} = -0.16 \pm 0.22$  $K_S \pi^0 \gamma: \ C_{CP} = -0.07 \pm 0.12 \ S_{CP} = -0.15 \pm 0.20$ 

#### **EPS-HEP 2023**

$$\begin{array}{l} C_{CP} = 0.10 \pm 0.13 \pm 0.03 \\ S_{CP} = 0.00^{+0.27+0.03}_{-0.26-0.04} \end{array} \quad \begin{array}{l} C_{CP} = \\ S_{CP} = 0.00^{+0.27+0.03}_{-0.26-0.04} \end{array}$$

 $C_{CP} = -0.06 \pm 0.25 \pm 0.07$  $S_{CP} = 0.04^{+0.45}_{-0.44} \pm 0.10$ 

#### Most precise result till date

## $B^0 \rightarrow K_s \pi^0 \gamma$

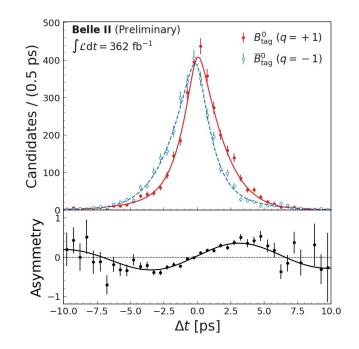

- No prompt tracks challenge
- Reconstruct vertex only from K<sub>s</sub> using beam-spot constraint
- To measure C<sub>CP</sub> in a time integrated manner, candidates with poor vertex reconstruction are used
- Fake beam background  $\pi^0$  are suppressed using MVA method to select one candidate

- SM measurement with large BF and experimentally clean signature
- Validate Flavor Tagger (FT) performance
- New flavor tagger (GFIaT) based on graph neural network (GNN), which uses inter-relational information between particles, developed in Belle II
- ~8% reduction in statistical uncertainty due to a GFIaT

$$C_{CP} = -0.035 \pm 0.026 \pm 0.012$$
  
$$S_{CP} = 0.724 \pm 0.035 \pm 0.014$$

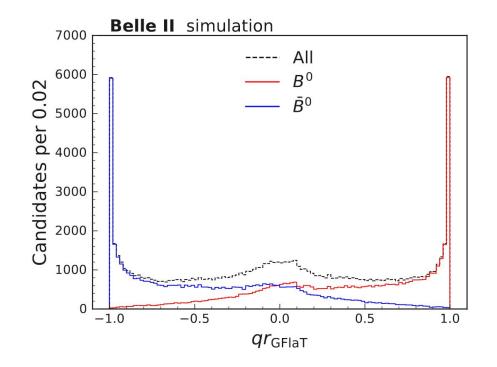

#### **EPS-HEP 2023**

HFLAV:  $C_{CP} = 0.000 \pm 0.020 S_{CP} = 0.695 \pm 0.019$ 

- Conventional FT:  $\epsilon_{tag}$  = 31.68 ± 0.45 ± 0.41%
- GFIaT:  $\epsilon_{tag}$  = 37.40 ± 0.43 ± 0.34%
- ~18% increase in tagging efficiency compared to conventional flavor tagger!

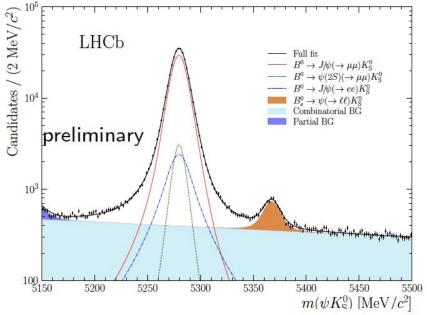

- New LHCb Run 2 (6 fb<sup>-1</sup>) results using  $B_d \rightarrow J/\psi K_s$  (both muons and electrons) and  $B_d \rightarrow \psi(2S) K_s$  tagged time dependent analysis to determine sin 2 $\beta$  (= sin 2 $\Phi_1$ )
- Using Run 1 (3  $fb^{-1}$ ) + Run 2 data:

$$egin{aligned} S_{\psi K_{
m S}^0} &= 0.717 \pm 0.013 \, {
m (stat)} \pm 0.008 \, {
m (syst)} \ C_{\psi K_{
m S}^0} &= 0.008 \pm 0.012 \, {
m (stat)} \pm 0.003 \, {
m (syst)} \end{aligned}$$

#### 2309.09728 [hep-ex]

#### (Submitted to PRL)

#### LHCB-PAPER-2023-013

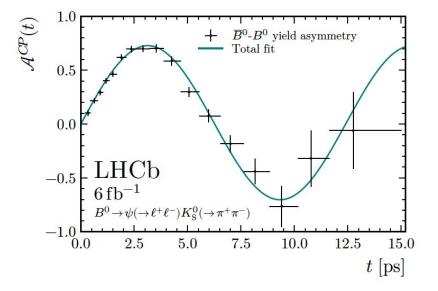

(Simultaneous fit of 3 decay modes,  $B^0 \rightarrow J/\psi$  (l<sup>+</sup>l<sup>-</sup>) K<sub>s</sub> and  $B^0 \rightarrow \psi$ (2S) ( $\mu^+\mu^-$ ) K<sub>s</sub>, where l = e or  $\mu$ )

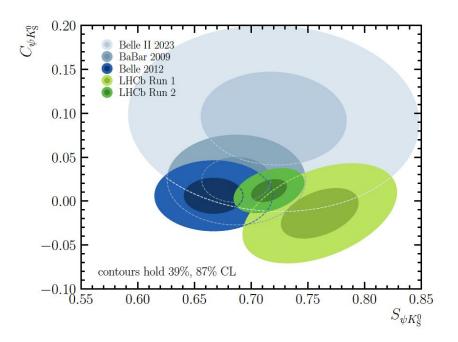

- Small CP violation asymmetry observed
- Consistent with SM predictions
- Using Run 1 (3 fb<sup>-1</sup>) + Run 2 data, using combination of measurements:

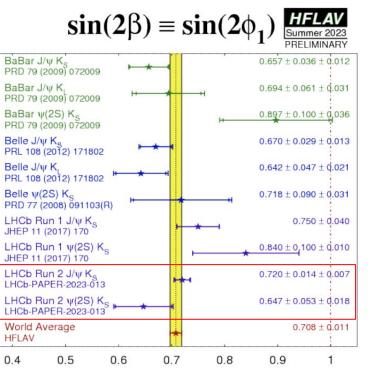

$$S_{\psi K_{\rm S}^0}^{\rm Run\ 1\&2} = 0.724 \pm 0.014 \,(\text{stat+syst})$$
$$C_{\psi K_{\rm S}^0}^{\rm Run\ 1\&2} = 0.004 \pm 0.012 \,(\text{stat+syst})$$

LHCb Run 2 result most precise to date

### **Summary and Outlook**

• CP violation is being tested at several experiments, such as Belle II/ LHCb/BESIII. Exciting results to follow in future.

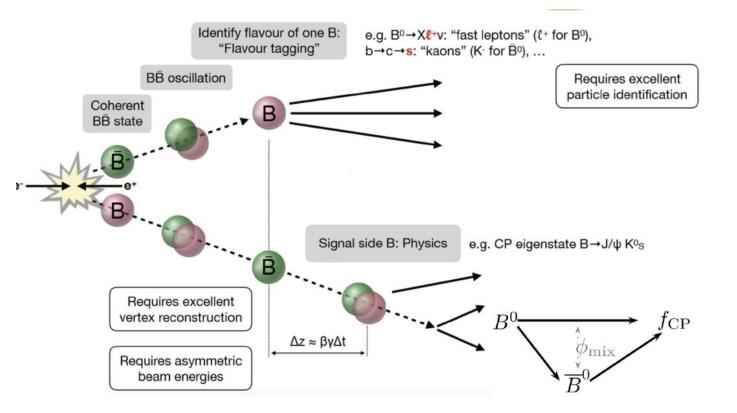

- Current focus is search for new physics corrections to SM CP violation.
- No evidence for new CP violation so far.
- Large datasets will allow precision measurements.
